The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 19-26 and 35-58 are rejected under 35 U.S.C. 102(e) as being anticipated by Zhang '075

The applied reference has a common assignee with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

The previous rejection still applies. Contrary to applicant's arguments the insulation layer with carbon of Zhang is used as the gate insulator as it naturally forms during the CVD process for the gate insulator. As stated the carbon comes from either the organic carrier gas or from the carbon impurities in the semiconductor material oxidized.

Claims 19-26 and 35-58 are rejected under 35 U.S.C. 102(b) as anticipated by Jp '6790 or, in the alternative, under 35 U.S.C. 103(a) as obvious over Jp '679 in view of Jp '267.

The previous rejection with the above comments applies.

Applicant's arguments filed 5/11/05 have been fully considered but they are not persuasive. As stated above Zhang teaches carbon impurities in the gate insulation layer. Arguments that the prior art does not teach carbon impurities in a gate insulating

layer are unpersuasive as all the oxide layers of the Zhang device have some trace of carbon impurities as explained in the previous rejections. Again, contrary to applicant's arguments on page 10 of the remarks, Yamazaki '670 and Chiyou clearly do teach a first silicon oxide layer and a gate insulator of silicon oxide. Clearly, layers 12 and 15 of either Zhang or Yamazaki are silicon oxide material.
